

The Art of Forecasting: Secondary Progressions, Progressed Lunar Phase & Solar Return

Secondary Progressions describe the Cosmos in slow motion; one day of 'above' equals one year of 'below'. This method is used for identifying important developmental times in a person's life and is a powerful predictive tool.

The Progressed Lunation Cycle gives us important long-term background information. Every 30 years, the Progressed New Moon initiates the emergence of a new vision. A person's lunation phase indicates the current stage in this 30-year process.

A Solar Return is a chart calculated for the exact time of the Sun's return to its natal position. As a transit chart it indicates current environmental factors & the trend of experience for the following year.
